BETONICA (Beton.)

Botanical name: *Betonica officinalis* Linn.

Family: Labiatae

Uses: Produces pain in various parts. Analgesic.

Homoeopathically used in pains in right temple, abdomen, hepatic region, transverse colon, gall bladder, right inguinal region and spermatic cord.

Synonyms: *Stachys officinalis*; *French*:S. Betonica Benth; *Era/As/*/Betony, Bishopswort.

Description: A hardy perennial herb 30 to 90 cm high, lower leaves long petioled, ovate, oblong, crenate, obtuse, cordate at the base, 7 to 15 cm long; upper leaves distant, sessile, oblong-lanceolate, acute. Flowers purple, in a dense terminal spike.

Microscopical: Petiole: Vascular strand in the form of a continuous arc with very much incurved ends or even tending to become cylindrical. Additional/subsidiary vascular bundles present in the petiole wings.

Distribution: Europe to Caucasia.

Constituents: Betonicine $C_7H_{13}NO_3$ m.p. 254°-256°(d) hydrochloride, 216°-217°; aurichloride 242°.

History and authority: Boericke: *Mat. Med. and Repertory*, 9th Ed., 122.

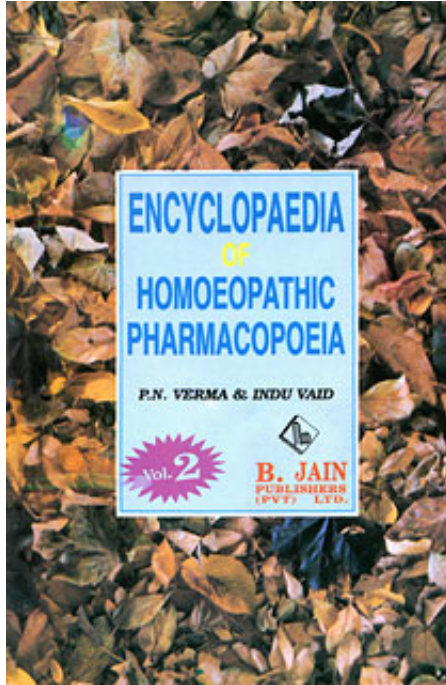

Part used: Whole plant.

Preparation:

a) <i>Mother Tincture</i> 4>	Drug strength 1/10
