BLOOD PRESSURE.

INTRODUCTION.

By the term BLOOD PRESSURE people are inclined to think of a serious disease of modern civilisation. Blood-pressure does not, in the strict sense of the term, mean a disease at all. It is essential for life, and every living man or woman carries some degree of blood pressure.

In certain pathological states the blood pressure rises above the normal figure, sometimes reaching such heights as to become a source of imminent danger to life. This raised blood pressure is not a disease by itself, but a sign or manifestation of a pathological process just as fever is not a disease but a measurable external index of an internal malady. It might be said in consonance both with reason and science, that the rise of blood pressure is a CONSERVATIVE or COMPENSATORY process by which adequate circulation of blood is maintained in the tissues in spite of increased resistance or obstruction to the flow of blood. If the blood pressure would fail to rise while the obstruction to the flow of blood be increasing, the inevitable result would be death from failure of circulation. To bring the analogy closer between fever and increased blood pressure, it may be asserted that a rise of blood pressure is a necessary evil to support life in adverse circumstances of blood-flow as much as fever is an unpleasant reaction but, nevertheless, conducive to the body to fight out the invading disease. But both fever and blood pressure should remain within safe limits, and

every effort should be made to reduce them when they assume alarming proportions. It must be borne in mind that a drastic reduction of fever or blood pressure by drugs is fraught with grave consequences, and should by no means be attempted. Removal of the cause to which the body reacts by fever or increased blood pressure is the ideal method of treatment.

High blood pressure, which is also known as HYPERTENSION, seems to be commoner in modern times than in the good old days. It cannot be denied that the modern civilisation has brought in its trail a great deal of adverse factors tending to raise blood pressure. Intensive struggle for existence associated with continual anxiety, greedy ambition, artificial methods of living, want of faith in religion, intemperance, irregular hours, adulterated and unwholesome food, and many vices peculiar to modern civilisation do undoubtedly play important parts in its causation. Moreover, with the discovery of the Sphygmomanometer, the detection of raised blood pressure has become an easy affair and, therefore, more cases are brought to the notice of the profession today than before. However, it cannot be contended that Hypertension was a rarity in the good old days, since Apoplexy (Sannyash Roga) has been dealt with in the medical treatises of the Ayurvedic System of Medicine.

CIRCULATION.

In order to appreciate the importance of blood pressure a thorough understanding of the CIRCULATION is requisite. Circulation means a continual out-flow of blood from the heart along certain channels called the arteries and the
