THE HOMOEOPATHIC APPROACH TO CANCER

INTRODUCTION

The last few years have witnessed remarkable progress in understanding the biologic and biochemical bases for cancer.

This is not to imply that the problem of neoplastic disease is solved, because despite in surgery, chemotherapy, and radiation therapy, cancer accounts for fourth of all deaths in the United States each year.

This paper provides an overview of the definition, etiology, Miasmatic aspects, Homoeopathic treatment followed by a description of the anthroposophical drugs.

Definition

The disease called cancer is best defined by four characteristics which describe how cancer cells act differently from their normal counter parts.

- a) **Clonality** : In most cases, cancer originates from a single stem cell which proliferates to form a clone of malignant cells.
- b) **Autonomy** : Growth is not properly regulated by the normal biochemical and physical influences in the environment.
- c) **Anaplastic** : There is lack of normal coordinated cell differentiation.
- d) **Metastasis** : Cancer cells developed the capacity for discontinuous growth and dissemination to other parts of the body.

Philosophy of Tumor Cell Biology

Since all cells in an organism originate from single fertilized egg (Zygote), all carry the identical genetic information. The proliferation and differentiation of this cell into an embryo, and eventually into a mature organism, involve selective and co-ordinated expression of the

member is warm or hot.

Psychologically the patient is conscientious and orderly, he cannot bear to be corrected or opposed. He is intellectually active, must be occupied, finds relief in action, movement and active exercise. He is extremely self-conscious, shuns crowds, but is also averse to complete solitude and likes to have someone around. He is apprehensive before an ordeal, from diffidence and lack of self confidence, but rises to the occasion when it arrives. He is fearful of the dark, of failure, from appearing in public.

A noticeable attribute is lack of aptitude for finance and commerce, not good either argument or arithmetic.

A definitely chilly individual. Hates the cold and feels paralysed thereby in both mind and muscle. At the same time he also tends to flag in great heat.

Appetite is apt to be capricious. Starts a meal quite hungry but feels satisfied over a few mouthful. In the matter of food preferences and dislikes, there is a definite fondness for sugar and sweet things and marked preference for hot meals and hot fluids, also for scurries. There is a tendency to eat too fast. There is intolerance of cabbage, peas, beans, milk, pastry, onions, oysters which tend to upset the digestion.

May perspire on slightest exertion—a cold clammy sweat with odour of onions.

The symptoms usually tend to be right sided and then extended to left.

Flatulent dyspepsia becomes an important concomitant with most of the *Lycopodium* complaints.

6. THE CALCAREAS

Of the three great calcium salts, calcarea fluor is the only one which exhibits a neoplastic element. It confers on glands or connective tissue—a stony induration (*Conium*, *Carbo animalis*). It acts as well in breast, bone and uterine cancer

Calcarea phos has hardly any action on cancer or pre-cancerous states.
