INTRODUCTION

Poultry includes, a number of avian species such as chicken, turkeys, geese, guinea fowls which have been domesticated and reared for their flesh, eggs and feathers. Chicken alone accounts for about 90% of the total poultry.

Poultry farming in India has registered a phenomenal growth during the last two and half decades and today India ranks fifth in world egg production. Poultry sector contributes around Rs. 15,000 to the gross national product (GNP) and employs, over half a million people. The increasing awareness of the nutritive value of eggs and thereby the need for a balanced meal has led to the change in eating habits with vegetarians, accepting egg as a part of their diet. Simultaneously, there has been an increase in the purchasing power and more money is available for spending on quality food resulting in an additional 10% demand for eggs and poultry flesh per year. Nutritionally, people eat poultry meat

is proved that this science has a tremendous range of treatment, which can fill up many gaps that exist in the present system of medicine.

Important Hints

Poultry keeping is a delicate industry requiring observation on feeding, management and disease control. Generally major losses are due to contagious and infectious diseases. Once the flock is affected, the whole farm becomes involved and it loses its existence. The diseases in which major losses are noticed are, Ranikhet, Fowl pox, Coccidiosis, Gumboro, Salmonellosis, etc. Other diseases are produced due to unhygienic conditions, contaminated water, food, excess heat, cold, etc.

Infectious diseases are so fatal that the owner hardly has any time to control it. Hence prevention is better than cure. To avoid the diseases and losses, emphasis should be given on the following points:

1. Vaccination schedule should be followed strictly. Cold chain maintenance is important to preserve the potency of vaccine. Administration of the required dose should be strictly followed.
2. Farms should be kept hygienically clean, dampness should be avoided. Clean water should be supplied. Accumulation of water in the vicinity of the farm
